

1. INTRODUCTION

GreenMetrics Auditing Partners was retained by EcoCorp Inc. to conduct a thorough evaluation of the company's environmental claims, energy usage, and carbon neutralization strategies for the calendar year 2025.

2. METHODOLOGY

The audit was conducted in accordance with ISO 14064-3 standards. Data was gathered from utility bills, fleet fuel logs, and internal accounting records.

3. EMISSIONS PROFILE (SCOPE 1 & 2)

The company operates three data centers and a corporate headquarters. The primary source of emissions is electricity purchased from the grid, which relies heavily on natural gas and coal generation.

- Direct Emissions (Scope 1): 300 tCO2e
- Indirect Emissions (Scope 2): 1,200 tCO2e
- Total Calculated Emissions: 1,500 tCO2e annually.

4. OFFSETS AND RENEWABLE ENERGY STRATEGY

During the audit period, investigators reviewed the company's ledger for purchases of Verified Carbon Units (VCUs) or Renewable Energy Certificates (RECs).

Findings:

- No budget was allocated for carbon offsetting programs in 2025.
- The company has not purchased any Renewable Energy Certificates (RECs).
- Operations remain 100% reliant on standard local grid electricity.

5. AUDIT CONCLUSION

While the company has expressed future intent to become more sustainable, the current operational reality shows ongoing, unabated carbon emissions totaling 1,500 tCO2e. There are currently no active measures, offsets, or neutralization programs in place to mitigate this footprint.
